## Revised Listing of Claims:

- 1 1. (withdrawn): A magnetic media hard disk, comprising:
- 2 a substrate;
- 3 a magnetic layer;
- 4 at least one underlayer being disposed between said substrate and said magnetic layer;
- 5 an overcoat layer being disposed above said magnetic layer, said overcoat layer being
- 6 comprised of diamond-like carbon (DLC), and wherein carbon atoms of said DLC layer are
- 7 generally implanted into said magnetic layer to a depth of less than approximately 10 Å, and
- 8 wherein the density of said overcoat layer is between approximately 2.0 g/cm<sup>3</sup> and
- 9 approximately 2.9 g/cm<sup>3</sup>.
- 1 2. (withdrawn): A magnetic disk as described in claim 1 wherein the thickness of said
- 2 overcoat layer is from approximately 25 Å to approximately 100 Å.
- 1 3. (withdrawn): A magnetic disk as described in claim 1 wherein the thickness of said
- 2 overcoat layer is from approximately 25 Å to approximately 60 Å.
- 1 4. (withdrawn): A magnetic disk as described in claim 1 wherein the thickness of said
- 2 overcoat layer is approximately 35 Å.
  - 5. (withdrawn): A magnetic disk as described in claim 1 wherein said overcoat layer includes nitrogen.

- 1 6. (withdrawn): A magnetic disk as described in claim 5 wherein said overcoat layer
- 2 includes nitrogen in the range of approximately 2 at. % to approximately 20 at. %.
- 1 7. (withdrawn): A hard disk drive, comprising:
- at least one magnetic media hard disk being adapted for rotary motion upon a disk drive
- 3 motor spindle;
- at least one slider device having a slider body portion being adapted to fly over said
- 5 magnetic media hard disk;
- a magnetic head being formed on said slider body for writing data to said magnetic media
- 7 hard disk and reading data from said magnetic media hard disk;
- 8 said magnetic media hard disk, including:
- 9 a substrate;
- 10 a magnetic layer;
- 11 at least one underlayer being disposed between said substrate and said magnetic layer;
- 12 an overcoat layer being disposed above said magnetic layer, said overcoat layer being
- 13 comprised of diamond-like carbon (DLC), and wherein carbon atoms of said DLC layer are
- 14 generally implanted into said magnetic layer to a depth of less than approximately 10 Å, and
- wherein the density of said overcoat layer is between approximately 2.0 g/cm<sup>3</sup> and
- 16 approximately 2.9 g/cm<sup>3</sup>.
- 1 8. (withdrawn): A hard disk drive as described in claim 7 wherein the thickness of said
- 2 overcoat layer is from approximately 25 Å to approximately 100 Å.

- I 9. (withdrawn): A hard disk drive as described in claim 7 wherein the thickness of said
- 2 overcoat layer is from approximately 25 Å to approximately 60 Å.

IPLO®

- 1 10. (withdrawn): A hard disk drive as described in claim 7 wherein the thickness of said
- 2 overcoat layer is approximately 35 Å.
- 1 11. (withdrawn): A hard disk drive as described in claim 7 wherein said overcoat layer
- 2 includes nitrogen.
- 1 12. (withdrawn): A hard disk drive as described in claim 11 wherein said overcoat layer
- 2 includes nitrogen in the range of approximately 2 at. % to approximately 20 at. %.
- 1 13. (currently amended): A process for fabricating a magnetic media hard disk comprising:
- 2 fabricating a magnetic media layer upon a surface material of a substrate;
- fabricating a diamond-like carbon (DLC) layer upon said magnetic layer by:
- 4 fabricating an initial thickness portion of said DLC layer upon said magnetic layer
- 5 utilizing a relatively low ion carbon beam energy of less than approximately 20 eV;
- 6 fabricating a subsequent thickness portion of said DLC layer upon said initial
- 7 thickness portion of said DLC layer utilizing at least one relatively high subsequent carbon ion
- 8 beam energy of greater than approximately 50 eV.

Jun 21 04 11:44a IPL00 1.408.558.9960 p.8

- 1 14. (original): A process for fabricating a magnetic media hard disk as described in claim 13
- 2 wherein said relatively low carbon ion beam energy is approximately 10 eV to approximately 20
- 3 eV.
- 1 15. (currently amended): A process for fabricating a magnetic media hard disk as described
- 2 in claim 14 wherein said relatively high subsequent ion beam energy is approximately 100 eV.
- 1 16. (currently amended): A process for fabricating a magnetic media hard disk as described
- 2 in claim 13, including fabricating an intermediate thickness portion of said DLC layer between
- 3 said initial thickness portion and said subsequent thickness portion, wherein said intermediate
- 4 thickness portion is fabricated utilizing a relatively mid-range carbon ion beam energy between
- 5 said relatively low carbon ion beam energy and said relatively-high subsequent carbon ion beam
- 6 energy.
- 1 17. (previously presented): A process for fabricating a magnetic media hard disk as
- 2 described in claim 16 wherein said mid-range carbon ion beam energy is approximately 50 eV.
- 1 18. (previously presented): A process for fabricating a magnetic media hard disk as
- 2 described in claim 17 wherein said DLC layer has a thickness of approximately 10 Å following
- 3 the deposition of said initial thickness portion, and said DLC layer has a thickness of
- 4 approximately 19 Å following the deposition of said intermediate thickness portion, and said
- 5 DLC layer has a final thickness of approximately 25 Å following the deposition of said
- 6 subsequent thickness portion.

- 1 19. (original): A method for fabricating a magnetic media hard disk as described in claim 18
- 2 wherein said DLC layer is formed with a density of approximately 2.0 g/cm<sup>3</sup> to approximately
- $3 2.9 g/cm^3$ .
- 1 20. (previously presented): A method for fabricating a magnetic media hard disk as
- 2 described in claim 13 wherein nitrogen ion species are deposited along with said carbon ion
- 3 species within said subsequent thickness portion.
- 1 21. (original): A process for fabricating a magnetic media hard disk as described in claim 20
- 2 wherein said nitrogen species are deposited in a range of approximately 2 at. % to approximately
- 3 20 at. %.
- 1 22. (previously presented): A method for fabricating a magnetic media hard disk comprising:
- 2 fabricating a magnetic material layer upon a material surface of a substrate;
- fabricating a diamond-like carbon (DLC) layer upon said magnetic layer, wherein said
- 4 DLC layer is fabricated by:
- 5 depositing carbon ion species upon said magnetic layer utilizing a relatively low
- 6 carbon ion beam energy level of from approximately 10 eV to approximately 20 eV, to deposit
- 7 an initial thickness portion of said DLC layer;
- 8 subsequently increasing the energy level of said carbon ion beam as the thickness
- 9 of said DLC layer increases due to the deposition of said carbon ion species within said DLC
- 10 layer, such that a portion of the carbon ion beam species of said increased energy level carbon
- ion beam become implanted within said initial thickness portion of said DLC layer, and such that

( 2

- 12 another portion of said carbon ion beam species of said increased energy level carbon ion beam
- 13 become deposited on top of said initial thickness portion of said DLC layer.
- 1 23. (original): A method for fabricating a magnetic media disk as described in claim 22
- 2 wherein said carbon ion beam energy level is varied smoothly with time.
- 1 24. (original): A method for fabricating a magnetic media hard disk as described in claim 22
- 2 wherein said carbon ion beam energy level varies as a step function with time.
- 1 25. (previously presented) A method for fabricating a magnetic media hard disk as described
- 2 in claim 23 wherein nitrogen ion species are implanted along with said carbon ion species within
- 3 said DLC layer thickness.
- 1 26. (original): A method for fabricating a magnetic media hard disk as described in claim 25
- 2 wherein said nitrogen ion species are included within said DLC layer in a range of approximately
- 3 2 at. % to approximately 20 at. %.
- 1 27. (previously presented): A process for fabricating a magnetic media hard disk,
- 2 comprising:
- 3 fabricating a magnetic media layer upon a surface material of a substrate;
- 4 fabricating a diamond-like carbon (DLC) layer including carbon ion species upon said
- 5 magnetic layer, by:

- fabricating an initial thickness portion of said DLC layer upon said magnetic layer
- 7 utilizing a relatively low ion carbon beam energy of from approximately 10 eV to approximately
- 8 20 eV;

6.3

- 9 fabricating a subsequent thickness portion of said DLC layer upon said initial thickness
- 10 portion of said DLC layer utilizing a higher carbon ion beam energy, wherein a portion of the
- carbon ion species of said subsequent thickness portion penetrates into said initial thickness
- portion and not into said magnetic media layer, and another portion of said carbon ion species of
- said subsequent layer are disposed on top of said initial thickness portion.
- 1 28. (previously presented): A process for fabricating a magnetic media hard disk as
- 2 described in claim 27 including:
- 3 fabricating a further thickness portion of said DLC layer upon said subsequent thickness
- 4 portion of said DLC layer utilizing a higher carbon ion beam energy, wherein a portion of the
- 5 carbon ion species of said further thickness portion penetrate into said subsequent thickness
- 6 portion and into said initial thickness portion, and not into said magnetic media layer, and
- 7 wherein another portion of said carbon ion species of said further thickness layer are disposed on
- 8 top of said subsequent thickness portion.
- 1 29. (previously presented): A process for fabricating a magnetic media heard disk as
- 2 described in claim 27 wherein said carbon ion beam energy of said subsequent thickness portion
- 3 is approximately 50 eV and wherein said carbon ion beam energy of said further thickness
- 4 portion is approximately 100 eV.
